Constructions

3.1. CONSTRUCTION WITHOUT MEASUREMENT

ACTIVITY 1

Aim: To draw parallel and perpendicular lines using a set square.

Materials Required: Set square, ruler, pencil.

- Divide the class in pairs.
- Instruction them to use a set square and ruler to draw parallel lines.
- Keep the set square on the ruler and draw \overline{AB} , now move the set square along the ruler as shown in figure.
- Draw \overline{CD} , observe \overline{CD} is parallel to \overline{AB}

3.2. BISECTOR OF AN ANGLE

Bisecting an angle means drawing a ray in the interior of an angle such the angle is divided into two equal angles.

Construction of the Bisector of a Given Angle using a Pair of Compasses

An angle $\angle AQB$ is given. Let us draw a ray OX , bisecting $\angle AQB$.

Steps of Construction

Step 1: With Q as centre and any radius, draw an arc, cutting \overline{QA} and \overline{QB} at M and N respectively.

Step 2: With M as centre and radius more than half of MN , draw an arc. With centre at N and the same radius as before, draw another arc, cutting the previous drawn arc at a point R .

Step 3: Join QR and produce it to any point X .

Then, ray \overline{QX} bisects $\angle AQB$ into two equal angles, namely, $\angle AQX$, and $\angle BQX$.

3.3. CONSTRUCTION OF 75° , 105° , 135° AND 150°

(a) Let us first revise the construction of 30° , 45° , 60° and 90° .

(i) To construct an angle of 60°

Steps of construction

1. Draw any straight line OA .
2. With O as centre and any (suitable) radius, draw an arc to meet OA at C .
3. With C as centre and same radius as in step 2, draw an arc to meet the previous arc at D .
4. Join O, D and produce it to B .

Then $\angle AOB = 60^\circ$.

(ii) To construct an angle of 30°

We observe that $\frac{0^\circ + 60^\circ}{2} = 30^\circ$, therefore, if $\angle AOB = 60^\circ$ and OE is the bisector of $\angle AOB$, then $\angle AOE = 30^\circ$.

Steps of construction

1. Construct $\angle AOB = 60^\circ$
2. With C as centre and any suitable radius (greater than half of OC), draw an arc. Also, with D as centre and same radius, draw another arc to meet the previous arc at E .
3. Join O, E and produce it to F . Then OE bisects $\angle AOB$.

Therefore, $\angle AOF = 30^\circ$

**(iii) To construct an angle of 90°** **Steps of construction**

1. Draw any straight line OA .
2. With O as centre and any suitable radius, draw an arc to meet OA at C .
3. With C as centre and same radius, (as in step 2) draw an arc to meet the previous arc at D . With D as centre and same radius, draw another arc to meet the first arc at E .
4. With D and E as centres draw two arcs of equal radius (greater than half of CD), cutting each other at F .
5. Join O, F and produce it to B . Then $\angle AOB = 90^\circ$

Note that: $\frac{60^\circ + 120^\circ}{2} = \frac{180^\circ}{2} = 90^\circ$

Here $\angle AOD = 60^\circ$,

$$\angle AOE = 120^\circ \text{ so that}$$

$$\angle DOE = 120^\circ - 60^\circ = 60^\circ$$

$$\angle DOF = \frac{1}{2} \times 60^\circ = 30^\circ,$$

because OF is the bisector of $\angle DOE$.

$$\begin{aligned}\angle AOF &= \angle AOD + \angle DOF \\ &= 60^\circ + 30^\circ = 90^\circ\end{aligned}$$

(iv) To construct an angle of 45°

We observe that $\frac{0^\circ + 90^\circ}{2} = 45^\circ$, therefore, if $\angle AOB = 90^\circ$ and OG is the bisector of $\angle AOB$, then $\angle AOG = 45^\circ$

Steps of construction

1. Construct $\angle AOB = 90^\circ$
2. With C as centre and any suitable radius greater than $\frac{1}{2}CF$, draw an arc. Also, with F as centre and same radius, draw another arc to meet the previous arc at G .

Note that: $\frac{0^\circ + 90^\circ}{2} = \frac{90^\circ}{2} = 45^\circ$

Here OH is the bisector of $\angle AOB$,

3. Join O, G and produce it to H .
Then $\angle AOH = 45^\circ$

(b) Now, let us construct angles of $75^\circ, 105^\circ, 135^\circ$, and 150° .

We observe that if $\angle AOB = \theta$ and $\angle AOC = \phi$, then $\angle BOC = \angle AOC - \angle AOB = \phi - \theta$. If OD bisects $\angle BOC$, then

$$\angle BOD = \frac{1}{2} \angle BOC = \frac{\phi - \theta}{2} \text{ so that}$$

$$\begin{aligned}\angle AOD &= \angle AOB + \angle BOD \\ &= \theta + \frac{\phi - \theta}{2} = \frac{\theta + \phi}{2}.\end{aligned}$$

(i) To construct an angle of 75°

Note that: $\frac{60^\circ + 90^\circ}{2} = \frac{150^\circ}{2} = 75^\circ$

Steps of construction

1. Construct $\angle AOB = 60^\circ$
2. Construct $\angle AOC = 90^\circ$
then $\angle BOC = 90^\circ - 60^\circ = 30^\circ$

3. Let OD be the bisector of $\angle BOC$, then $\angle BOD = \frac{1}{2} \times 30^\circ = 15^\circ$, so that

$$\begin{aligned}\angle AOD &= \angle AOB + \angle BOD \\ &= 60^\circ + 15^\circ = 75^\circ\end{aligned}$$

(ii) To construct an angle of 105°

Note that: $\frac{90^\circ + 120^\circ}{2} = \frac{210^\circ}{2} = 105^\circ$

Steps of construction

1. Construct $\angle AOB = 90^\circ$
2. Construct $\angle AOC = 120^\circ$
then $\angle BOC = 120^\circ - 90^\circ = 30^\circ$
3. Let OD be the bisector of $\angle BOC$
then $\angle BOD = \frac{1}{2} \times 30^\circ = 15^\circ$, so that

$$\begin{aligned}\angle AOD &= \angle AOB + \angle BOD \\ &= 90^\circ + 15^\circ = 105^\circ\end{aligned}$$

(iii) To construct an angle of 135°

Note that: $\frac{90^\circ + 180^\circ}{2} = \frac{270^\circ}{2} = 135^\circ$

Steps of construction

1. Construct $\angle AOB = 90^\circ$
2. Produce AO to C , then
 $\angle AOC = 180^\circ$
and $\angle BOC = 180^\circ - 90^\circ = 90^\circ$
3. Let OD be the bisector of $\angle BOC$
then $\angle BOD = \frac{1}{2} \times 90^\circ = 45^\circ$, so that

$$\begin{aligned}\angle AOD &= \angle AOB + \angle BOD \\ &= 90^\circ + 45^\circ = 135^\circ\end{aligned}$$

(iv) To construct an angle of 150°

Note that: $\frac{120^\circ + 180^\circ}{2} = \frac{300^\circ}{2} = 150^\circ$

Steps of construction

1. Construct $\angle AOB = 120^\circ$
2. Produce AO to C , then
 $\angle AOC = 180^\circ$ and
 $\angle BOC = 180^\circ - 120^\circ = 60^\circ$

3. Let OD be the bisector of $\angle BOC$, then $\angle BOD = \frac{1}{2} \times 60^\circ = 30^\circ$,

so that

$$\begin{aligned}\angle AOD &= \angle AOB + \angle BOD \\ &= 120^\circ + 30^\circ = 150^\circ.\end{aligned}$$

3.4. CONSTRUCTION OF TRIANGLES AND QUADRILATERALS**(a) Construction of Triangles****(i) To construct a triangle when the lengths of three sides are given**

Example 1. Construct a triangle ABC such that $AB = 5.8$ cm, $BC = 4.8$ cm and $AC = 3.5$ cm.

Steps of construction

1. Draw line segment $AB = 5.8$ cm.
2. With B as centre and radius $= BC = 4.8$ cm, draw an arc,
3. With A as centre and radius $= AC = 3.5$ cm, draw an arc to cut the arc of step 2 at C .
4. Join AC and BC .

Then ABC is the required triangle.

(ii) To construct a triangle when two sides and the included angle are given

Example 2. Construct a triangle ABC such that $AB = 4.1$ cm, $BC = 4.9$ cm and $\angle B = 120^\circ$.

Steps of construction

1. Draw line segment $AB = 4.1$ cm.
2. At B , construct $\angle ABD = 120^\circ$
3. From BD , cut off $BC = 4.9$ cm
4. Join AC .

Then ABC is the required triangle.

(iii) To construct a triangle when one side and two angles are given

When two angles say $\angle A$ and $\angle B$ of a triangle ABC are given, then since $\angle A + \angle B + \angle C = 180^\circ$, the third angle $\angle C = 180^\circ - \angle A - \angle B$ also becomes known.

Example 3. Construct a triangle ABC such that $BC = 7.5$ cm, $\angle B = 45^\circ$ and $\angle C = 60^\circ$

Steps of construction

1. Draw line segment $BC = 7.5$ cm
2. At B , construct $\angle CBD = 45^\circ$
3. At C , construct $\angle BCE = 60^\circ$
4. Let BD and CE intersect at A .

Then ABC is the required triangle.

Example 4. Construct an isosceles triangle ABC having base $BC = 6.8$ cm and $\angle B = 30^\circ$.

Since the base angles of an isosceles triangle are equal, therefore $\angle B = \angle C = 30^\circ$

Steps of construction

1. Draw line segment $BC = 6.8$ cm
2. At B , construct $\angle CBD = 30^\circ$
3. At C , construct $\angle BCE = 30^\circ$
4. Let BD and CE intersect at A .

Then ABC is the required isosceles triangle.

**(iv) To construct a quadrilateral when three sides and two diagonals are given**

Example 5. Construct a quadrilateral $ABCD$ in which $AB = 5.5$ cm, $AD = 4.4$ cm, $CD = 6.5$ cm, $AC = 6.5$ cm and $BD = 7.1$ cm.

Steps of construction

1. Construct triangle ABD
2. Construct triangle ACD .
3. Join BC .

Then $ABCD$ is the required quadrilateral.

(v) To construct a parallelogram whose one side and both diagonals are given

To construct parallelograms, we use the following facts:

1. Opposite sides of a parallelogram are equal.
2. Diagonals bisect each other.

Example 6. Construct a parallelogram $ABCD$ given that $AB = 4$ cm, $AC = 4.6$ cm and $BD = 6.2$ cm.

Steps of construction

1. Construct triangle OAB with

$$AB = 4 \text{ cm}$$

$$AO = \frac{1}{2} AC = \frac{1}{2} \times 4.6 = 2.3 \text{ cm and}$$

$$BO = \frac{1}{2} BD = \frac{1}{2} \times 6.2 = 3.1 \text{ cm.}$$

2. Produce AO to C such that $OC = OA$
3. Produce BO to D such that $OD = OB$.
4. Join BC, CD, AD .

Then, $ABCD$ is the required parallelogram.

3.5. CONSTRUCTING LOCI

Locus is the set of all points in a plane which satisfy one or more geometrical conditions.

Alternatively, locus of a moving point is the path traced by the point under a given set of geometrical conditions.

Important facts about locus

1. Every point which satisfies the given geometrical condition(s) lies on the locus.
2. Every point which lies on the locus satisfies the given geometrical condition(s).

Thus, a point P lies on locus $\Leftrightarrow P$ satisfies the given geometrical condition(s).

Example 7. Let $\{P_1, P_2, P_3, \dots\}$ be the set of points in a plane such that their distance from a fixed point C in the plane is a positive constant r . Then, $CP_1 = CP_2 = CP_3 = \dots = r$.

Solution. We observe that the curve through all these point is a circle with the fixed point C as centre and the constant distance r as radius.

Conversely, if P is any point on the circle then its distance from the centre C is the radius r , i.e., $CP = r$ for all points P on the circle.

Thus, a circle is the set of all points in a plane (i.e. locus) which are at a constant distance from a fixed point in the plane. The fixed point is the centre and the constant distance is the radius of the circle.

EXERCISE

1. Construct a quadrilateral $ABCD$ such that $AB = 4.2$ cm, $BC = 3.7$ cm, $CD = 4.3$ cm, $AD = 3.1$ cm and $\angle A = 60^\circ$.
2. Construct a quadrilateral $ABCD$ in which $AB = 4.4$ cm, $BC = 4$ cm, $CD = 6.4$ cm, $AD = 2.8$ cm and $BD = 6.6$ cm.
3. Draw a parallelogram $ABCD$ in which $AC = 6.8$ cm, $BD = 5$ cm and an angle between them is 60° .
4. Construct a triangle ABC in which $BC = 8$ cm, $AB = 5$ cm and $\angle ABC = 60^\circ$. Mark a point P which is equidistant from AB , BC and also from B and C .
5. Draw a line segment of length 6.6 cm. Bisect it and measure the length of each part.
6. Construct a $\triangle ABC$ in which $BC = 3.6$ cm, $AB + AC = 4.8$ cm and $\angle B = 60^\circ$.
